

9) Write a Java program to create three threads that perform three different tasks simultaneously: displaying numbers, calculating the sum of numbers, and displaying even numbers.

PROGRAM:

```
class DisplayNumbers extends Thread {  
    public void run() {  
        for (int i = 1; i <= 10; i++) {  
            System.out.println("Number: " + i);  
        }  
    }  
}
```

```
class SumNumbers extends Thread {  
    public void run() {  
        int sum = 0;  
  
        for (int i = 1; i <= 10; i++) {  
            sum += i;  
        }  
  
        System.out.println("Sum: " + sum);  
    }  
}
```

```
class EvenNumbers extends Thread {  
    public void run() {  
        for (int i = 1; i <= 10; i++) {  
            if (i % 2 == 0) {  
                System.out.println("Even Number: " + i);  
            }  
        }  
    }  
}
```

```
    }  
    }  
    }  
}
```

```
public class Main {  
    public static void main(String[] args) {  
  
        DisplayNumbers t1 = new DisplayNumbers();  
        SumNumbers t2 = new SumNumbers();  
        EvenNumbers t3 = new EvenNumbers();  
  
        t1.start();  
        t2.start();  
        t3.start();  
    }  
}
```

OUTPUT:

Number: 1

Number: 2

Number: 3

Even Number: 2

Even Number: 4

Sum: 55

Number: 4

Even Number: 6

Number: 5

Even Number: 8

Number: 6

Even Number: 10

Number: 7

Number: 8

Number: 9

Number: 10
